Author : LAW MAN FAI

Problem statement: To build a CNN based model which can accurately detect melanoma. Melanoma is a type of cancer that can be deadly if not detected early. It accounts for 75% of skin cancer deaths. A solution which can evaluate images and alert the dermatologists about the presence of melanoma has the potential to reduce a lot of manual effort needed in diagnosis.

Importing Skin Cancer Data

To do: Take necessary actions to read the data

Importing all the important libraries

```
import pathlib
import tensorflow as tf
import matplotlib.pyplot as plt
import numpy as np
import pandas as pd
import os
import PIL
from tensorflow import keras
from tensorflow.keras import layers
from tensorflow.keras.models import Sequential
```

```
## If you are using the data by mounting the google drive, use the following :
from google.colab import drive
drive.mount('/content/gdrive')

##Ref:https://towardsdatascience.com/downloading-datasets-into-google-drive-via-google-colab-bcb1b30b0166
```

```
Mounted at /content/gdrive
```

This assignment uses a dataset of about 2357 images of skin cancer types. The dataset contains 9 sub-directories in each train and test subdirectories. The 9 sub-directories contains the images of 9 skin cancer types respectively.

```
# Defining the path for train and test images
## Todo: Update the paths of the train and test dataset
data_dir_train = pathlib.Path("/content/gdrive/My Drive/CNN_assignment/Skin cancer ISIC The International Skin Imaging Collaboration/Train/")
data_dir_test = pathlib.Path("/content/gdrive/My Drive/CNN_assignment/Skin cancer ISIC The International Skin Imaging Collaboration/Test/")
```

```
image_count_train = len(list(data_dir_train.glob('*/*.jpg')))
print(image_count_train)
image_count_test = len(list(data_dir_test.glob('*/*.jpg')))
print(image_count_test)
```

```
2239
118
```

Load using keras.preprocessing

Let's load these images off disk using the helpful image_dataset_from_directory utility.

Create a dataset

Define some parameters for the loader:

```
batch_size = 32
img_height = 180
img_width = 180
```

Use 80% of the images for training, and 20% for validation.

```
## Write your train dataset here
## Note use seed=123 while creating your dataset using tf.keras.preprocessing.image_dataset_from_directory
```

```
## Note, make sure your resize your images to the size img_height*img_width, while writting the dataset
train_ds = tf.keras.utils.image_dataset_from_directory(
    data_dir_train,
    validation_split=0.2,
    subset="training",
    seed=123,
    image_size=(img_height, img_width),
    batch_size=batch_size)
```

```
Found 2239 files belonging to 9 classes.
Using 1792 files for training.
```

```
## Write your validation dataset here
## Note use seed=123 while creating your dataset using tf.keras.preprocessing.image_dataset_from_directory
## Note, make sure your resize your images to the size img_height*img_width, while writting the dataset
val_ds = tf.keras.utils.image_dataset_from_directory(
    data_dir_train,
    validation_split=0.2,
    subset="validation",
    seed=123,
    image_size=(img_height, img_width),
    batch_size=batch_size)
```

```
Found 2239 files belonging to 9 classes.
Using 447 files for validation.
```

```
# List out all the classes of skin cancer and store them in a list.
# You can find the class names in the class_names attribute on these datasets.
# These correspond to the directory names in alphabetical order.
class_names = train_ds.class_names
print(class_names)
```

```
['actinic keratosis', 'basal cell carcinoma', 'dermatofibroma', 'melanoma', 'nevus', 'pigmented benign keratosis', 'seborrheic keratosis', 'squa
```

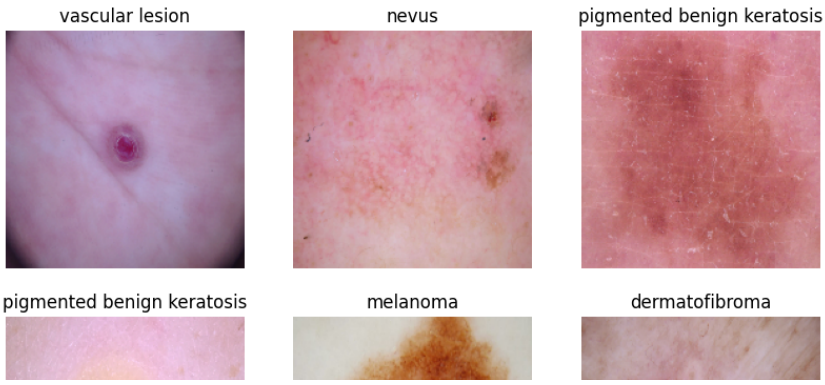
Visualize the data

Todo, create a code to visualize one instance of all the nine classes present in the dataset

```
import matplotlib.pyplot as plt

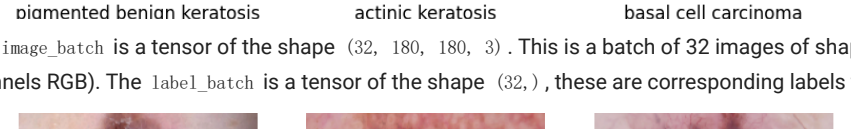
### your code goes here, you can use training or validation data to visualize

plt.figure(figsize=(10, 10))
for images, labels in train_ds.take(1):
    for i in range(9):
        ax = plt.subplot(3, 3, i + 1)
        plt.imshow(images[i].numpy().astype("uint8"))
        plt.title(class_names[labels[i]])
        plt.axis("off")
```



```
for image_batch, labels_batch in train_ds:
    print(image_batch.shape)
    print(labels_batch.shape)
    break
```

```
(32, 180, 180, 3)
(32,)
```



The `image_batch` is a tensor of the shape `(32, 180, 180, 3)`. This is a batch of 32 images of shape `180x180x3` (the last dimension refers to color channels RGB). The `label_batch` is a tensor of the shape `(32,)`, these are corresponding labels to the 32 images.

`Dataset.cache()` keeps the images in memory after they're loaded off disk during the first epoch.

`Dataset.prefetch()` overlaps data preprocessing and model execution while training.

```
AUTOTUNE = tf.data.experimental.AUTOTUNE
train_ds = train_ds.cache().shuffle(1000).prefetch(buffer_size=AUTOTUNE)
val_ds = val_ds.cache().prefetch(buffer_size=AUTOTUNE)
```

Create the model

Todo: Create a CNN model, which can accurately detect 9 classes present in the dataset. Use `layers.experimental.preprocessing.Rescaling` to normalize pixel values between (0,1). The RGB channel values are in the `[0, 255]` range. This is not ideal for a neural network. Here, it is good to standardize values to be in the `[0, 1]`

```
num_classes = len(class_names)

model = Sequential([
    layers.Rescaling(1./255, input_shape=(img_height, img_width, 3)),
    layers.Conv2D(16, 3, padding='same', activation='relu'),
    layers.MaxPooling2D(),
    layers.Conv2D(32, 3, padding='same', activation='relu'),
    layers.MaxPooling2D(),
    layers.Conv2D(64, 3, padding='same', activation='relu'),
    layers.MaxPooling2D(),
    layers.Flatten(),
    layers.Dense(128, activation='relu'),
    layers.Dense(num_classes,activation='softmax')
])
```

Compile the model

Choose an appropirate optimiser and loss function for model training

```
### Todo, choose an appropirate optimiser and loss function
model.compile(optimizer='adam',
                           loss=tf.keras.losses.SparseCategoricalCrossentropy(from_logits=True),
                           metrics=['accuracy'])

# View the summary of all layers
model.summary()
```

```
Model: "sequential"

plt.show()
```

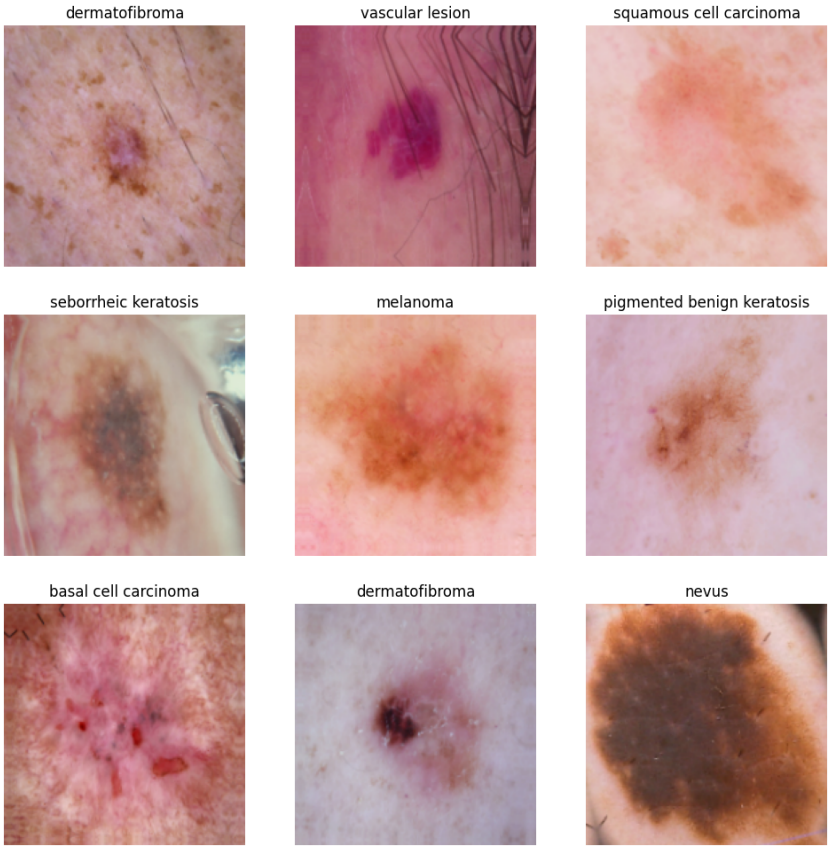
Todo: Write your findings after the model fit, see if there is an evidence of model overfit or underfit

Answer: The model has achieved only around 55% accuracy on the validation set but 95% accuracy, it is overfitting.

```
# Todo, after you have analysed the model fit history for presence of underfit or overfit, choose an appropriate data augmentatio
data_augmentation = keras.Sequential(
    [
        layers.RandomFlip("horizontal_and_vertical",
                                    input_shape=(img_height,
                                                 img_width,
                                                 3)),
        layers.RandomRotation(0.1, fill_mode='reflect'),
        layers.RandomZoom(0.1),
    ]
)
```

```
# Todo, visualize how your augmentation strategy works for one instance of training image.

plt.figure(figsize=(12, 12))
for images, labels in train_ds.take(1):
    for i in range(9):
        ax = plt.subplot(3, 3, i + 1)
        plt.imshow(data_augmentation(images)[i].numpy().astype("uint8"))
        plt.title(class_names[labels[i]])
        plt.axis("off")
```



Todo:

Create the model, compile and train the model

```
model = Sequential([
    data_augmentation,
    layers.Rescaling(1./255, input_shape=(img_height, img_width, 3)),
    layers.Conv2D(16, 3, padding='same', activation='relu'),
    layers.MaxPooling2D(),
    layers.Dropout(0.25),
    layers.Conv2D(32, 3, padding='same', activation='relu'),
    layers.MaxPooling2D(),
    layers.Conv2D(64, 3, padding='same', activation='relu'),
    layers.MaxPooling2D(),
    layers.Dropout(0.25),
    layers.Flatten(),
    layers.Dense(128, activation='relu'),
```

```
    layers.Dropout(0.25),
    layers.Dense(num_classes,activation='softmax')
])
```

Compiling the model

```
## Your code goes here
model.compile(optimizer='adam',
                           loss=tf.keras.losses.SparseCategoricalCrossentropy(from_logits=True),
                           metrics=['accuracy'])
```

```
model.summary()
```

```

```

Todo: Write your findings after the model fit, see if there is an evidence of model overfit or underfit. Do you think there is some improvement now as compared to the previous model run?

Answer: ovewfit is still exist but the loss is few and the data accuracy is drop to 55%

Todo: Find the distribution of classes in the training dataset.

Context: Many times real life datasets can have class imbalance, one class can have proportionately higher number of samples compared to the others. Class imbalance can have a detrimental effect on the final model quality. Hence as a sanity check it becomes important to check what is the distribution of classes in the data.

```
from glob import glob
path_list = [x for x in glob(os.path.join(data_dir_train, '*', '*.jpg'))]
lesion_list = [os.path.basename(os.path.dirname(y)) for y in glob(os.path.join(data_dir_train, '*', '*.jpg'))]

path_list += [x for x in glob(os.path.join(data_dir_test, '*', '*.jpg'))]
lesion_list += [os.path.basename(os.path.dirname(y)) for y in glob(os.path.join(data_dir_test, '*', '*.jpg'))]

df_dict_org = dict(zip(path_list, lesion_list))
org_df = pd.DataFrame(list(df_dict_org.items()),columns = ['Path','Label'])
org_df
```

- **Todo:** Write your findings here:

  - Which class has the least number of samples?

  - Which classes dominate the data in terms proportionate number of samples?

  Answer-1 :- seborrtheic keratosis has least number of samples

  Answer-2:- pigmented benign keratosis and melanoma have proprtionate number of classes

- **Todo:** Rectify the class imbalance

  Context: You can use a python package known as `Augmentor` (https://augmentor.readthedocs.io/en/master/) to add more samples across all classes so that none of the classes have very few samples.

```
!pip install Augmentor
```

```
Collecting Augmentor

```

To use `Augmentor`, the following general procedure is followed:

1. Instantiate a `Pipeline` object pointing to a directory containing your initial image data set.
2. Define a number of operations to perform on this data set using your `Pipeline` object.
3. Execute these operations by calling the `Pipeline's sample()` method.

```
path_to_training_dataset="/content/gdrive/My Drive/CNN_assignment/Skin cancer ISIC The International Skin Imaging Collaboration/Train/"
import Augmentor
for i in class_names:
    #p = Augmentor.Pipeline(path_to_training_dataset + i)
    p = Augmentor.Pipeline(path_to_training_dataset + i, output_directory='/content/gdrive/My Drive/CNN_assignment/Augmentor/'+i+'/')
    p.rotate(probability=0.7, max_left_rotation=10, max_right_rotation=10)
    p.sample(500) ## We are adding 500 samples per class to make sure that none of the classes are sparse.
```

```

```

Augmentor has stored the augmented images in the output sub-directory of each of the sub-directories of skin cancer types.. Lets take a look at total count of augmented images.

```
data_dir_train_aug = pathlib.Path('/content/gdrive/My Drive/CNN_assignment/Augmentor/')
```

```
image_count_train = len(list(data_dir_train_aug.glob('*/*.jpg')))
print(image_count_train)
```

```
4500
```

```
%cd '/content/gdrive/My Drive/CNN_assignment/Org_With_Aug_Data'
```

```
/content/gdrive/My Drive/CNN_assignment/Org_With_Aug_Data
```

```
# copy orginal train and augmented data into another folder
```

```
%cd '/content/gdrive/My Drive/CNN_assignment/Augmentor/'
%cp -av * '/content/gdrive/My Drive/CNN_assignment/Org_With_Aug_Data/' >> /dev/null
```

```
/content/gdrive/My Drive/CNN_assignment/Augmentor
```

```
%cd '/content/gdrive/My Drive/CNN_assignment/Skin cancer ISIC The International Skin Imaging Collaboration/Train'
%cp -av * '/content/gdrive/My Drive/CNN_assignment/Org_With_Aug_Data' >> /dev/null
```

```
/content/gdrive/My Drive/CNN_assignment/Skin cancer ISIC The International Skin Imaging Collaboration/Train
```

```
%cd '/content/gdrive/My Drive/CNN_assignment/Org_With_Aug_Data'
%ls
```

```
/content/gdrive/My Drive/CNN_assignment/Org_With_Aug_Data
'actinic keratosis'/    'pigmented benign keratosis'/
'basal cell carcinoma'/ 'seborrheic keratosis'/
 dermatofibroma/        'squamous cell carcinoma'/
 melanoma/              'vascular lesion'/
 nevus/
```

Lets see the distribution of augmented data after adding new images to the original training data.

```
data_dir_train_aug='/content/gdrive/My Drive/CNN_assignment/Org_With_Aug_Data/'
path_list_new = [x for x in glob(os.path.join(data_dir_train_aug, '*', '*.jpg'))]
len(path_list_new)
```

```
6739
```

```
lesion_list_new = [os.path.basename(os.path.dirname(y)) for y in glob(os.path.join(data_dir_train_aug, '*', '*.jpg'))]
len(lesion_list_new)
```

```
6739
```

```
dataframe_dict_new = dict(zip(path_list_new, lesion_list_new))
```

```
df2 = pd.DataFrame(list(dataframe_dict_new.items()),columns = ['Path','Label'])
#new_df = org_df.append(df2)
new_df=pd.concat([org_df, df2], ignore_index=True)
```

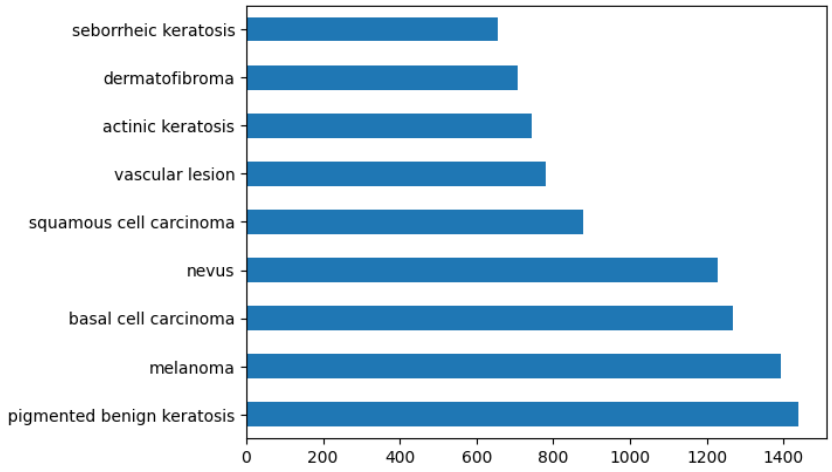
```
new_df['Label'].value_counts()
```

```
pigmented benign keratosis    1440
melanoma                      1392
basal cell carcinoma          1268
nevus                         1230
squamous cell carcinoma        878
vascular lesion                781
actinic keratosis              744
dermatofibroma                 706
seborrheic keratosis           657
Name: Label, dtype: int64
```

```
CountStatus = new_df.value_counts(new_df['Label'].values, sort=True)
```

```
CountStatus.plot.barh()
```

```
<Axes: >
```



So, now we have added 500 images to all the classes to maintain some class balance. We can add more images as we want to improve training process.

Todo: Train the model on the data created using Augmentor

```
batch_size = 32
img_height = 180
img_width = 180
```

Todo: Create a training dataset

```
train_ds = tf.keras.preprocessing.image_dataset_from_directory(
    data_dir_train_aug,
    seed=123,
    validation_split = 0.2,
    subset ='training',
    image_size=(img_height, img_width),
    batch_size=batch_size)
```

```
Found 6739 files belonging to 9 classes.
Using 5392 files for training.
```

Todo: Create a validation dataset

```
val_ds = tf.keras.preprocessing.image_dataset_from_directory(
    data_dir_train_aug,
    seed=123,
    validation_split = 0.2,
```

```
    subset  =  'validation',
    image_size=(img_height,  img_width),
    batch_size=batch_size)
```

```
Found 6739 files belonging to 9 classes.
Using 1347 files for validation.
```

```
AUTOTUNE  =  tf.data.experimental.AUTOTUNE
train_ds  =  train_ds.cache().shuffle(1000).prefetch(buffer_size=AUTOTUNE)
val_ds  =  val_ds.cache().prefetch(buffer_size=AUTOTUNE)
```

Todo: Create your model (make sure to include normalization)

```
model  =  Sequential([
    data_augmentation,
    layers.Rescaling(1./255,  input_shape=(img_height,  img_width,  3)),
    layers.Conv2D(16,  3,  padding='same',  activation='relu'),
    layers.MaxPooling2D(),
    layers.Dropout(0.25),
    layers.Conv2D(32,  3,  padding='same',  activation='relu'),
    layers.MaxPooling2D(),
    layers.Conv2D(64,  3,  padding='same',  activation='relu'),
    layers.MaxPooling2D(),
    layers.Dropout(0.25),
    layers.Flatten(),
    layers.Dense(128,  activation='relu'),
    layers.Dropout(0.25),
    layers.Dense(num_classes,activation='softmax')
])
```

Todo: Compile your model (Choose optimizer and loss function appropriately)

```
model.compile(optimizer='adam',
                          loss=tf.keras.losses.SparseCategoricalCrossentropy(from_logits=True),
                          metrics=['accuracy'])
```

Todo: Train your model

```
epochs  =  50
history  =  model.fit(
    train_ds,
    validation_data=val_ds,
    epochs=epochs
)
```

```

```

Todo: Visualize the model results

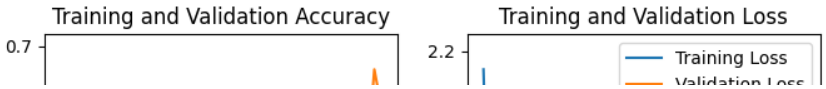
```
acc = history.history['accuracy']
val_acc = history.history['val_accuracy']

loss = history.history['loss']
val_loss = history.history['val_loss']

epochs_range = range(epochs)

plt.figure(figsize=(8, 8))
plt.subplot(1, 2, 1)
plt.plot(epochs_range, acc, label='Training Accuracy')
plt.plot(epochs_range, val_acc, label='Validation Accuracy')
plt.legend(loc='lower right')
plt.title('Training and Validation Accuracy')

plt.subplot(1, 2, 2)
plt.plot(epochs_range, loss, label='Training Loss')
plt.plot(epochs_range, val_loss, label='Validation Loss')
plt.legend(loc='upper right')
plt.title('Training and Validation Loss')
plt.show()
```



Todo: Analyze your results here. Did you get rid of underfitting/overfitting? Did class rebalance help?

Accuracy on training data is increased to around 65% by using Augmentor library.

The class rebalance is solved for overfitting issue.

For better accuracy, it can be solved by add more layer,neurons or adding dropout layers, and tuning the hyperparameter.
